

Radiation Oncology

Radiation Oncology at the Kantonsspital Graubünden offers first-class medical care for a wide range of tumors treated and cured with radiotherapy. The small but extremely competent team of physicians, radiation technicians and nurses stands for personal care. To achieve the best possible treatment outcome, the latest generation diagnostic in combination with modern radiation treatment machines are used exclusively.

Treatment of Cancer

Radiation oncology is one of the major forms of treatment of cancer. It uses precise radiation beams to destroy tumor cells effectively. Radiation is frequently used to treat female breast cancer after breast conserving therapy, allowing the breast's natural shape to be retained. Radiotherapy is also used in tumors of the prostate, lungs, lymph nodes, abdomen, bones, skin and brain.

Radiation is often combined with chemotherapy or surgery. At our hospital, the patient is comprehensively cared for in close collaboration with a highly competent and motivated team including radiation oncologists, cancer surgeons and oncologists.

Brachytherapy of Prostate Cancer

Iodine seed prostate brachytherapy is a very innovative and minimal-invasive procedure to cure early stage prostate cancer. Sources of weak radiation are implanted into the prostate gland under ultrasound guidance. This highly effective local treatment provides a high chance for cure and minimizes the side effect on adjacent organs including rectum, bladder and urethra to maintain optimal quality of life.

Second Opinion for Cancer Patients

Specialist Radiation Oncologists at the Kantonsspital Graubünden can provide individual unbiased, objective advice and recommendations before you have a surgical procedure or oncological treatment.

Mission

It is our mission offering you the most up-to-date cancer treatments within a highly competent and caring team. We take every step there is to make your cancer treatment at the Kantonsspital Graubünden as successful as possible.
