General Information

Radiation therapy or radiotherapy, often abbreviated RT, RTx, or XRT, is therapy using ionizing radiation, generally as part of cancer treatment to control or kill tumor cells.

Radiation therapy may be curative in a number of types of cancer if they are localized to one area of the body. It may also be used as part of therapy, to prevent tumor recurrence after surgery to remove a primary malignant tumor.

Radiation therapy is synergistic with chemotherapy, and has been used before, during, and after chemotherapy in susceptible cancers.

Radiation therapy has several applications in non-malignant conditions, such as the treatment of trigeminal neuralgia, acoustic neuromas, severe thyroid eye disease, pterygium, pigmented villonodular synovitis, and prevention of keloid scar growth, arthritis and heterotopic ossification.
